

Task Instructions:

1. **Review the Provided Data Sets**

Carefully examine the available data sets to understand the structure and content — including product names, store names, prices, and quantities.

2. **Logical Data Presentation**

Display the data in a clear and intuitive format of your choice (e.g., grouped by product, by store, or category). The goal is to make the information easy to explore and compare.

3. **Display Requirements**

For each product entry, be sure to show:

- **Product Name**
- **Store Name**
- **Price**
- **Quantity Available**

4. **Product Comparison Feature**

When a user selects a product from one store:

- Show **exact matches** from other stores (if available).
- Also display **closely related products** (e.g., similar brand, type, or variant) from other stores.

5. **Need Help?**

If anything is unclear or you need clarification, feel free to contact me.

6. **Optional Simplification**

To make development and testing easier, you're welcome to **narrow the scope initially** by working with a **smaller subset of products**, such as:

- **Soft Drinks**
- **Cheese**

Good luck!!
